

Ambient Air Test

Are you concerned about dust problems around your machinery? Are you aware of the consequences high ambient dust levels have on employee health? Are you experiencing inconsistencies in product quality and varying maintenance costs? Are you required to establish exact levels of ambient dust for health, fire insurance and/or environmental reasons?

If you are, we have the know-how, experience, and equipment to establish the amount of dust (in mg/m³) in the air around your machinery.

The dust level testing is carried out by taking strategically located air samples around your machinery during an eight-hour work period.

Dust level reports are issued within two weeks after analyses are returned to us by the air test laboratory. We will work with you to determine the proper method of improving working conditions, quality, and reducing possible hazards by eliminating problems created by dust.

Velocity guarantees dust collection system performance!

We welcome the opportunity to assist you in solving your dust control problems.
